Rock8Cloud
Powered by ProRocketeers

The AI-native cloud for teams that ship.

Our team went from 3 apps a month to 20, safely.

ProRocketeers teams. Almost 40 apps in the first two months on Rock8Cloud.

WHAT CHANGED

Same people, same AI agents. The difference is the tools they got.

Before, every new app waited a week for the same setup: pipeline, database, secrets, SSL, logs. Now your agent starts it from a blueprint or deploys a project you already have. It sees logs and errors in one place, so it has the context to fix them.

YOU `>_ claude mcp add rock8cloud --transport http https://app.rock8.cloud/mcp`

↳ Rock8Cloud connected to Claude Code.

YOU ✦ Start my shop from the TanStack blueprint.

AGENT Forked into your GitHub. Live at `https://shop.rock8cloud.app`

YOU `>_ git push`

↳ Deployed on push. Every pull request gets its own preview.

YOU ✦ What broke in the last deploy?

AGENT A slow query on /orders, missing an index. Fixing it in PR #44.

YOU ✦ Start an agent to add rate limiting.

AGENT On it. PR #51 opens with a preview when it is done.

Open-source blueprints we maintain. github.com/rock8-cloud

30 DAYS FREE · NO CARD

SAFE BY DEFAULT

Shipping fast does not have to be risky. The platform protects every app.

Building apps this fast with agents needs a new approach to security. Rock8Cloud makes it easy to set who can open an app, keeps databases off the internet and checks every build and running app for known vulnerabilities.

COMMON RISKS	ROCK8CLOUD HANDLES THEM
⚠ `postgres :5432` Your database on a public port	→ ✓ **No public database port** Only your own services can reach it.
⚠ `staging link` Anyone with the link can open it	→ ✓ **Only your team gets in** One click limits access to your organization.
⚠ `lodash 4.17.15 · CVE-2020-8203` Known vulnerability, never patched	→ ✓ **Every build and live app scanned** Risky builds are stopped, new vulnerabilities reported. Fix with agent — Implements the fix in a pull request.

NO VENDOR LOCK-IN

One open stack. Not six vendors.

Six vendors means six bills and six dashboards. Rock8Cloud bets on an open stack with no vendor lock-in, and brings it all together in one platform. Your apps run as standard Docker containers, so you can take them anywhere.

TYPICAL SAAS STACK		ROCK8CLOUD
Managed Postgres	Supabase · Neon · RDS	✓ PostgreSQL
Frontend deploys	Vercel · Netlify · Cloudflare Pages	✓ React · or any framework
Backend deploys	Railway · Fly · Render · AWS	✓ Docker · any language
Monitoring & logs	Datadog · Better Stack	✓ Included with every service
AI code review	CodeRabbit · Bugbot · billed per seat	✓ On every PR · included
Coding agents	Devin · background agents · per seat + usage	✓ Sandbox agents · included
Six bills, six dashboards.		**One bill, one flat price.**
